OCP COMMAND

Simple to use for operators and controllers via the OCP interface, this tool can significantly increase your production rates, through an automatic calculation of the distribution of angles. Once your movements are implemented, it will establish the most efficient production speed.

A desktop version will help designers to analyse a project's profitability beforehand and to transfer the first cam diagram to production, which can then be optimised on the machine.

In addition, the Pressmac OCP command allows for remote analysis or troubleshooting via a secure VPN network.
